

The Doors are in place:

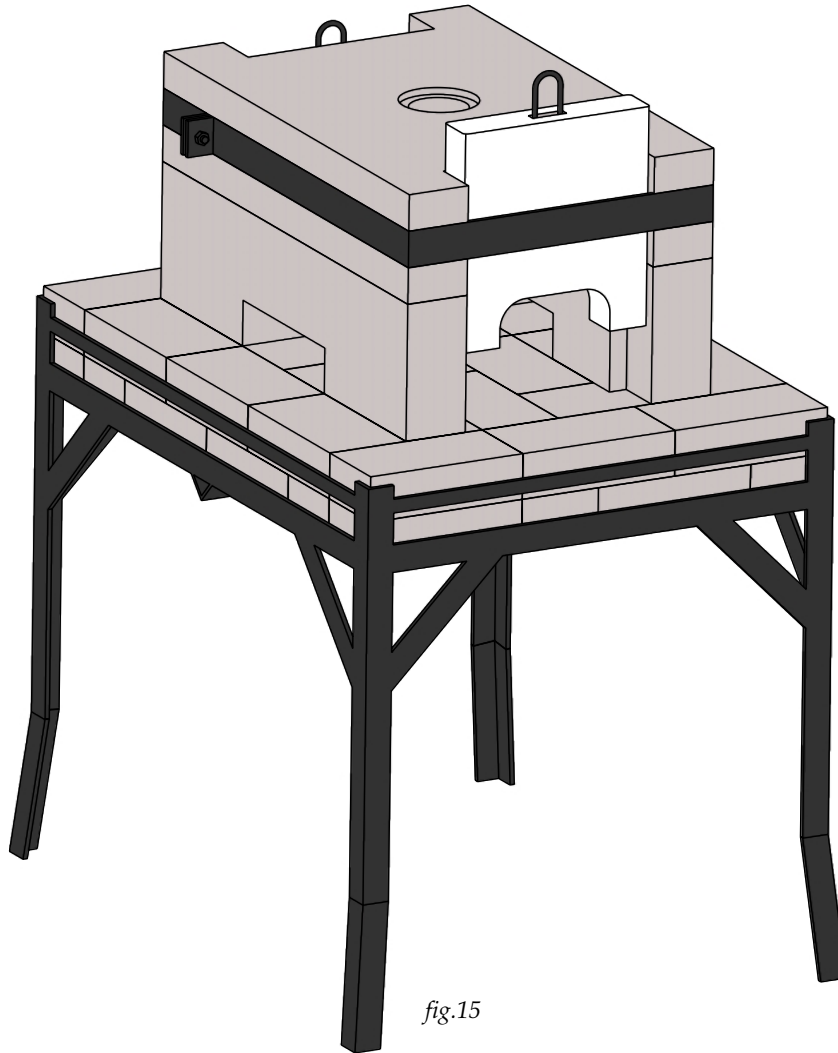

fig.15

To make your door system functional you will need to install a pulley system, using a section of light cable attached to the door lifting ring. Perhaps you could set a number of small holes along the edge of the door and pin it at various heights useful to your production. For me, I prefer the free-lifting of the door and the ability to set it back on top of the heating metal to preserve temperature in the forge.
